Identifying plant communities of thermophilous deciduous forest in Greece: Species composition, distribution, ecology and syntaxonomy

E. BERGMEIER¹ & P. DIMOPOULOS²

¹University of Göttingen, Albrecht von Haller Institute of Plant Sciences, Department of Vegetation Analysis & Phytodiversity, Göttingen, Germany and ²University of Ioannina, Department of Environmental and Natural Resources Management, Agrinio, Greece

Abstract

Thermophilous deciduous forest is widespread in northern mainland Greece and extends in patches further south to Peloponnisos and the bigger islands. In this paper, we provide a phytosociological survey of the plant communities of deciduous oak and mixed forest throughout Greece, based on about 370 relevés from the literature and more than 300 personal unpublished ones. Association names of the thermophilous deciduous forest are re-evaluated, and syntaxonomic conclusions added. The relevés are classified, and 13 associations and several additional subtypes described and presented in synoptic constancy tables. The following associations were recognized, and characterized by species composition, ecology and distribution: 1. *Phillyreо-Carpinetum orientalis*, 2. *Dryopterido pallidae-Ostryetum carpinifoliae*, 3. *Tilio tomentosae-Castanetum*; 4. *Genisto carinalis-Quercetum petraeae*, 5. *Querco frainetto-Castanetum*, 6. *Cytiso villosi-Castanetum*; 7. *Lathyrо laxiflori-Castanetum*; 8. *Sympyto ottomani-Quercetum frainetto*, 9. *Verbasco glabratи-Quercetum frainetto*; 10. *Huetio cynapioidis-Quercetum frainetto*; 11. *Digitali viridiflorae-Quercetum frainetto*; 12. *Geranio asphodeloidis-Quercetum frainetto*; 13. *Oenanthe pimpinelloidis-Quercetum frainetto*. Associations 1–2 are assigned to the alliance *Fraxino orni-Ostryion*, 4–6 and 8–13 to the *Quercion frainetto* (both *Quercetalia pubescens*), 3 interim to the *Tilio-Acerion*, and 7 to the *Quercetalia ilicis*. The two *Quercetalia pubescens* alliances co-occur in northern Greece; their habitats differ chiefly in terms of soil conditions, bedrock and topography, rather than in overall climatic character.

Key words: Greece, oak forest, phytosociology, Quercus, Quercetalia pubescens, submediterranean forest, vegetation classification

Introduction

Thermophilous deciduous forests are widely distributed in Greece, but have not yet been monographed except for contributions with a wider geographical scope (Horvat et al. 1974; Doniță et al. 2003). The potential range comprises about one-third of the Greek mainland from the north to the Peloponnisos (Bohn et al. 2000/2003; Bergmeier et al. 2004), but in real vegetation terms, the thermophilous deciduous forest covers only 7% (about 750,000 ha or 22% of the forested area) (Hellenic Ministry of Agriculture 1992). This statistical figure includes both open and dense forests and woodlands with trees generally taller than 7 m. Woody substitute vegetation, including semi-evergreen “pseudomaquis” and open

savanna-like pastures, do not fall under this definition, and were excluded from our study.

The most frequently dominating deciduous oak species of mainland Greece is *Quercus frainetto*. Other prevailing tree species are *Quercus petraea* subsp. *medwediewii* (*Q. dalechampii* sensu auct. balc.), *Q. cerris*, *Q. pubescens*, *Q. trojana*, *Castanea sativa*, *Carpinus orientalis*, *Tilia tomentosa*, *Ostrya carpinifolia* and *Fraxinus ornus*. Apart from *Quercus frainetto*, also *Q. petraea* and *Castanea sativa* tend to grow in pure stands, while the others are more or less common subordinate trees to which several less frequent species can be added. Most thermophilous deciduous forests are coppices which are cut at intervals for firewood, although only a fraction is still used in this way. The majority of coppices consist of stems

older than the usual coppice cycle of about 20 years. Many coppice woods are transferred to more productive stands for timber production. Old-growth forest with single-stemmed oaks is much less common. Both coppices and old-growth are commonly grazed by sheep or cattle, and sometimes frequented by domestic pigs. The proportion of pasture woods in the thermophilous deciduous forest is much higher than in beech, fir and pine forests.

For more detailed accounts on the diversity of thermophilous deciduous forest in Greece and the southern Balkans, its structure, dynamics, forestry, conservation issues, climate and soil conditions the reader is referred to our previous papers (Bergmeier et al. 2004; Bergmeier 2005; Dimopoulos et al. 2005). This study builds upon these surveys, but is focused on the plant communities and their relations in terms of species composition, diversity and distribution. Our objective is to describe and define the plant communities and to link them firmly to ICPN-verified phytosociological syntaxon names (Weber et al. 2000).

Materials and methods

Relevés of Greek thermophilous deciduous forest have been used more selectively for this survey than in our previous paper (Dimopoulos et al. 2005). Reliability in methodical standards (completeness of species records per relevé, taxonomic and geographical accuracy, presence of a proper set of environmental and structural data for each relevé) was a precondition. The size of most relevé plots was 100–400 m². Larger plots (900 m²) were accepted in a few cases. The following sources, containing original relevés, were evaluated: Zoller et al. (1977), Gamisans and Hebrard (1979, 1980), Raus (1980), Bergmeier (1990), Theodoropoulos (1991), Theodoropoulos et al. (1995), Petermann (1999), Dimopoulos and Bergmeier (2004), Tsaliki et al. (2005), as well as 307 of our own unpublished relevés. A total of 681 relevés was used. Plant communities with only very few available records were not taken into consideration, neither were stands of scrub less than 5 m in height. Riparian and lowland forests with *Quercus robur* subsp. *pedunculiflora* and woodlands with *Q. ithaburensis* subsp. *macrolepis* were excluded for coenological reasons and lack of data.

The relevés were extracted from the vegetation database of the first author and edited under the TURBOVEG vs. 2 database system (Hennekens & Schaminée 2001). The taxonomy and nomenclature of taxa in the original relevés were updated where necessary. Some taxa were recombined in order to achieve common taxonomic standards. The relevés were grouped into five subsets:

- *Quercus frainetto* dominated woodlands,
- woodlands with *Tilia tomentosa*,

- woodlands dominated by *Quercus petraea* subsp. *medwediewii* (*Q. dalechampii*),
- *Castanea sativa* woodlands, and
- mixed woodlands with cover values of more than (15–)25% of either *Carpinus orientalis*, *Fraxinus ornus*, *Ostrya carpinifolia*, *Quercus pubescens* and/or *Quercus trojana*.

Each of the five subsets was exported to JUICE 6.3 (Tichý 2002) and classified separately. Classification was assisted by Two-way indicator species analysis (TWINSPAN, Gauch & Whittaker 1981), using default settings and three (0, 5, 25) “pseudospecies cut levels”. Some of the TWINSPAN relevé clusters were recombined in order to improve interpretability. A few relevés were manually assembled in biogeographically corresponding clusters. Ordinations (CA, DCA, PCA) based on the entire presence-absence transformed data set were calculated, and a DCA scatter diagram with species scores was plotted and used for the present paper.

An overall synoptic table and several on certain plant communities or groups of communities were generated using JUICE (Tichý 2002) to demonstrate the distinctness and similarities in species composition among and within plant associations, and to underpin syntaxonomic arguments. Associations were defined by different species combinations, a distinct set of differential species, and specific biogeographical situation and abiotic environment. In most associations, community subtypes were recognized. Several such community subtypes were found with species combinations related to degradation by over-exploitation and wood pasture. The latter subtypes were excluded from the total set of 681 relevés, leaving 592 relevés as a basis for the overall synoptic table, thus omitting groupings that represent the most degraded variants of plant communities. The identification of diagnostic (given in bold letters) and constant species indicated in the community accounts below is based on a fidelity threshold of 33% and a frequency threshold of 66% (Tichý 2002).

Except for *Charybdis maritima* (Speta 2004), *Primula veris* subsp. *columnae* (Wisskirchen & Haeupler 1998), *Achnatherum bromoides* (Scholz & Raus 2006), *Scabiosa ochroleuca* (Greuter et al. 1986) and *Dorycnium herbaceum* (Greuter et al. 1989), the nomenclature of vascular plants follows basic floras: Tutin et al. (1968–1980), Strid (1986), Strid and Tan (1991, 1997, 2002).

Results

Species diversity

The data set comprises about 850 plant taxa (after taxonomic and nomenclatural evaluation and

update) of which 193 occur with at least 33% in one or more of the 13 associations. A total of 203 species reaches constancy values of 5% or more; 346 species of $\geq 2\%$, and 518 of $\geq 1\%$. The most common species in the whole data set are *Dactylis glomerata* s.l. (80%), *Veronica chamaedrys* s.l. (79%), *Luzula forsteri* (73%), *Quercus frainetto* (69%), *Brachypodium sylvaticum* (60%), *Potentilla micrantha* (58%), *Silene italica* s.l. (57%), *Lathyrus laxiflorus* (56%), and *Viola alba* s.l. (50%).

Figure 1 shows the distribution of the most important species in the relevés space spanned by the first two axes of a detrended correspondence analysis. The first axis ranges from species of acidic soils such as *Oenanthe pimpinelloides*, *Erica arborea*, *Castanea sativa*, *Cistus creticus* and *Arbutus unedo* on the left side of the diagram to the right side with *Acer hyrcanum*, *Ostrya carpinifolia*, *Fraxinus ornus* and *Hippocrepis emerus*. The latter species occur chiefly, though not exclusively, on limestone. The first axis is best interpreted as a gradient from base-poor or impoverished soils to base-rich calcareous soils. The second axis ranges from the lower part with *Rosa gallica*, *Quercus cerris*, *Q. pubescens*, *Lithospermum purpurocaeruleum* to the upper with species such as *Verbascum nigrum*, *Viola reichenbachiana*, *Mycelis muralis* and *Fagus sylvatica*. This axis is well interpretable as a gradient from dry and warm

conditions to mesic and relatively cool sites. It is a complex gradient of water supply and temperature.

Plant communities

Apart from the brief descriptions given below, the plant communities are presented as synoptic tables. An inventory of the species composition of the major units (phytosociological associations) is given in Table I. Distribution maps and a table with locality names (Table II) are also provided. The associations are described below in the sequence of Table I.

Phillyreo latifoliae–Carpinetum orientalis

(Table I, column 1; Table III)

Ecology and forest use: chiefly calcareous but occasionally schistose, rocky, sun-exposed slopes with stony soils that are drier than in habitats of the *Dryopterido–Ostryetum*; no current forest use but previously irregular wood cutting; current wood pasture occurs but is insignificant.

Distribution records (Figure 2): Epirus: near Konitsa, Timfi, Valaoritis; C and W Macedonia: Voras, Paiko, Chasia; E Thessaly: Kato Olimbos; E Macedonia: Rodopi; W Thrace; occurring as far south as C Peloponnisos (Bergmeier, unpubl.) and presumably much more widespread than available records suggest.

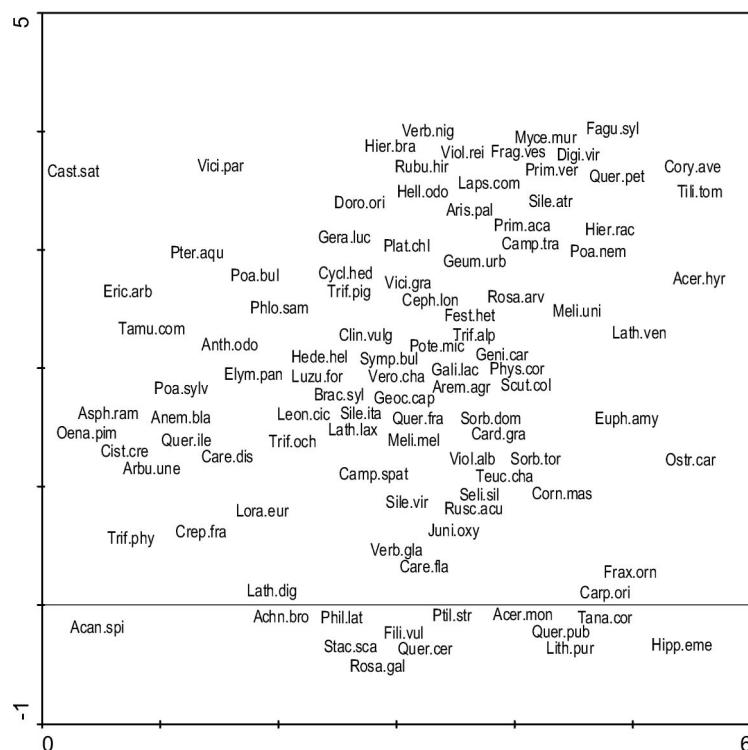

Figure 1. DCA species scores of the most important taxa in the entire data set of thermophilous deciduous forests in Greece. The names are abbreviated to four letters of the genus and three of the species epithet. See Table I for full names. Woody species are represented by occurrences in the highest strata. Eigenvalue of axis 1: 0.444, of axis 2: 0.330; sum of all eigenvalues with all species (854) and samples active: 17.108.

Table I. Synoptic constancy table of the associations of thermophilous deciduous forest found in Greece: PhC, *Phillyreо-Carpinetum orientalis*; DrO, *Dryopterido pallidae-Ostryetum carpinifoliae*; TiC, *Tilio tomentosae-Castanetum*; GQp, *Genisto carinalis-Quercetum petraeae*; QC, *Querco-Castanetum*; CyC, *Cytiso villosi-Castanetum*; LaC, *Lathyrо laxiflori-Castanetum*; SyQ, *Symphyto ottomani-Quercetum frainetto*, VeQ, *Verbasco glabratи-Quercetum frainetto*; HuQ, *Huetio-Quercetum frainetto*; DiQ, *Digitali viridiflorae-Quercetum frainetto*; GeQ, *Geranio asphodeloidis-Quercetum frainetto*; OeQ, *Oenanthe pimpinelloides-Quercetum frainetto*. Constancy values are in percent. The background was shaded for constancy values of taxa diagnostic for one or several associations (i.e. occurring with $\geq 20\%$ higher constancy value, but at least 40% constancy, in the respective column(s) than in others). Species with less than 33% constancy in any column are omitted. Strata codes for woody species: t, tree; s, shrub; h, herb layer.

Table III. Synoptic table of the associations and subtypes of the *Fraxino orni-Ostryion*: 1, *Carpinus orientalis*-*Quercus frainetto* community; 2-3, *Dryopterido pallidae-Ostryetum orientalis*, 2, subtype with *Trifolium pignantii*, 3, with *Euonymus verrucosus*; 4-5, *Phillyreto latifoliae-Carpinetum orientalis*, 4, with *Melica uniflora*, 5, with *Thymus longicaulis*. Constancy values in percent. Constancy values for species diagnostic for a community type (i.e. occurring with more than double constancy and with >40% in a column) are highlighted. Species with less than 29% constancy in any column are omitted. Strata codes for woody species: t, tree; s, shrub; h, herb layer.

<i>Trifolium alpestre</i>	.	.	10	.	31

Diagnostic (bold) and constant species:

Trees and tall shrubs: *Acer monspessulanum*, ***Carpinus orientalis***, ***Fraxinus ornus***, *Juniperus oxycedrus*, ***Ligustrum vulgare***, ***Phillyrea latifolia***, ***Quercus coccifera***, *Q. pubescens*, *Rosa arvensis*.

Herbs and small shrubs: ***Lithospermum purpureo-caeruleum***, *Viola alba*, *Veronica chamaedrys*.

Subtypes and related communities: Rather dense, little or not grazed woods (Table III: column 4) with *Melica uniflora*, *Aremonia agrimonoides*, *Cornus mas* and *Ligustrum vulgare*, found in C Macedonia (Voras, Paiko), Epirus (Valaoritis) and W Thrace can be distinguished from more or less open, semi-deciduous, stunted and species-rich brushwoods (Table III: 5) with *Thymus longicaulis*, *Achnatherum bromoides*, *Helictotrichon convolutum* and *Quercus pubescens*. Such stands are widely distributed throughout northern mainland Greece from Epirus to Thrace, and indicate a long-lasting history of fire impact, wood pasture and irregular cutting. Raus (1980) documented heavily degraded stands of

this from E Thessaly as *Quercus coccifera*–*Carpinus orientalis* community (pseudomaquis). Little disturbed is the “*Quercetum pubescens*” recorded by Zoller et al. (1977) from Mt. Athos but the material is too fragmentary to decide whether it matches the *Phillyrea*–*Carpinetum*, or has to be recognized as a different community.

Dryopterido pallidae-Ostryetum (Table I, column 2; Table III)

Ecology and forest use: calcareous, rocky, mostly steep shady upper and middle slopes, aspect commonly around north, often well developed rendzina soils; due to remoteness and difficult accessibility almost no current forest use, but most stands with marks of irregular coppicing in previous times, wood pasture insignificant.

Distribution records (Figure 2): C and W Macedonia: Voras, Paiko, Chasia; S Macedonia: Pieria; NE Thessaly: Kato Olimbos; Epirus: Timfi. Probably extending further south but no records available to date.

Diagnostic (bold) and constant species:

Trees and tall shrubs: ***Fraxinus ornus***, ***Ostrya carpinifolia***, ***Quercus pubescens***, ***Acer monspessulanum***, ***Carpinus orientalis***, ***Buxus sempervirens***, ***Euonymus verrucosus***, ***Hippocratea emerus*** subsp. *emeroides*, *Juniperus oxycedrus*, *Sorbus terminalis*.

Herbs and small shrubs: ***Arabis turrita***, *Aremonia agrimonoides*, ***Asplenium ceterach***, *Brachypodium sylvaticum*, *Dactylis glomerata* s.l., ***Daphne laureola***, ***Lithospermum purpureo-caeruleum***, *Melica uniflora*, *Potentilla micrantha*, *Silene italicica*, *Veronica chamaedrys* s.l., *Viola alba* s.l.

Subtypes and related communities: In suboceanic climatic conditions of NE Thessaly and N Pindos stands on chiefly subacidic soils are characterized by *Trifolium pignantii*, *Festuca heterophylla*, *Melittis melissophyllum*, *Quercus ilex*, *Dryopteris pallida* and *Luzula sylvatica* (Table III: 2). On calcareous flysch in C and W Macedonia and Epirus, stands are distinguished by *Euonymus verrucosus*, *Daphne laureola*, *Lathyrus venetus* and *Hippocratea emerus* (Table III: 3). Superficially similar are coppices dominated by *Carpinus orientalis* which occur in less exposed situations on calcareous and siliceous soils and developed from over-exploited deciduous oak forest. In NE Greece (Rodopi) such stands are not (anymore) grazed and *Quercus frainetto* is common in the tree layer (Table III: 1, *Carpinus orientalis*–*Quercus frainetto* community).

Tilio tomentosae-Castanetum (Table I, column 3; Table IV)

Ecology and forest use: steep, often north-exposed and chiefly lower slopes and in ravines with deep brown stony soils, relatively humid conditions;

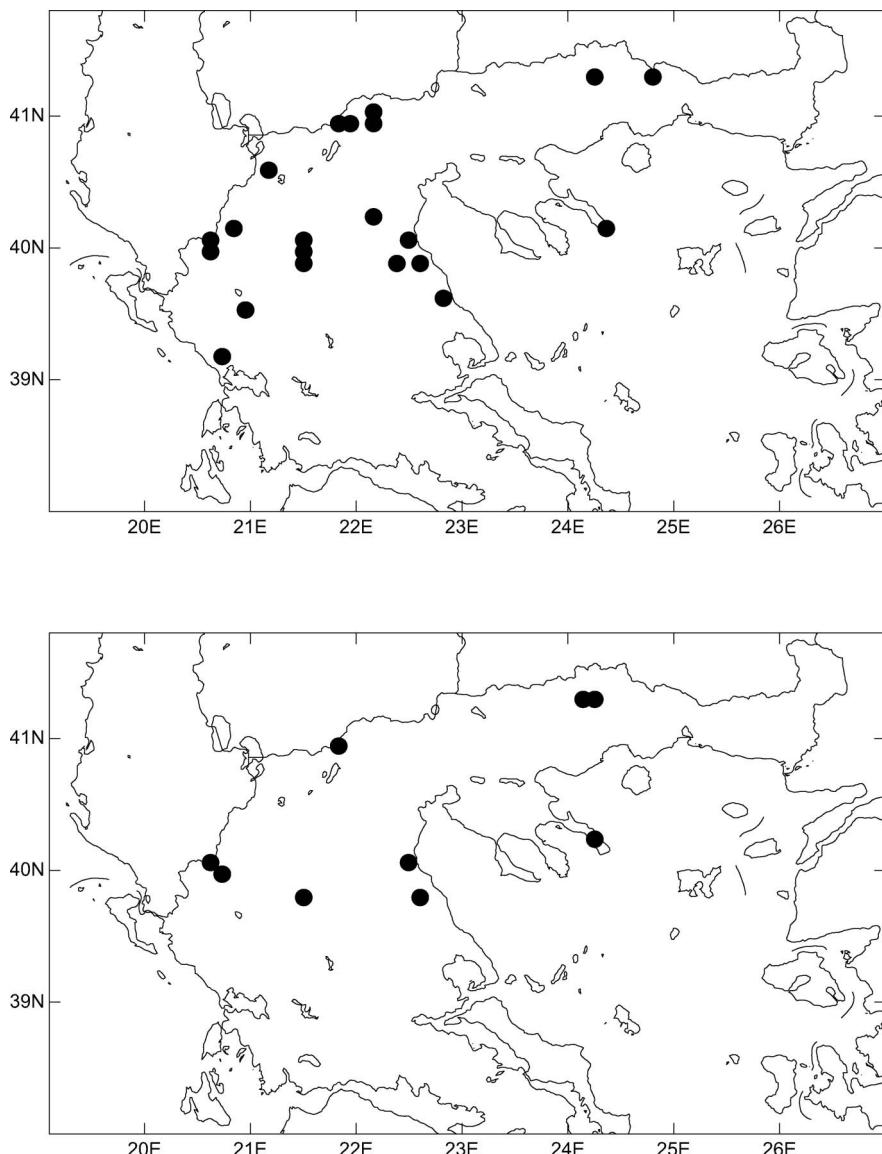

Figure 2. Above: Distribution of the *Fraxino ornii*-*Ostryion* communities *Phillyreo latifoliae-Carpinetum* and *Dryopterido pallidae-Ostryetum* in Greece; below: *Tilio tomentosae-Castanetum*. Each dot represents one or more relevés. Only localities with available relevés are plotted.

various types of bedrock including limestone, flysch, micaschist; stands are of little importance for forestry but have been used as irregular coppices and for wood pasture.

Distribution records (Figure 2): Epirus: near Konitsa; C and W Macedonia: Voras, Chasia; E Macedonia: Rodopi, Athos; NE Thessaly: Kato Olimbos, Ossa.

Diagnostic (bold) and constant species:

Trees and tall shrubs: *Tilia tomentosa*, *Acer hyrcanum*, *Fraxinus ornus*, *Hedera helix*, *Quercus petraea* subsp. *medwediewii*, *Sorbus torminalis*.

Herbs and small shrubs: *Asplenium onopteris* (+ *A. adiantum-nigrum*), *Campanula trachelium*, *Calamintha grandiflora*, *Festuca drymeja*, *Galium odoratum*, *Lathyrus venetus*, *Melica uniflora*, *Mycelis muralis*, *Poa nemoralis*, *Polystichum*

setiferum, *Primula acaulis*, ***Pulmonaria rubra***, ***Salvia glutinosa***.

Subtypes: Stands in NE Thessaly (Kato Olimbos) and C Macedonia (Voras) with *Aremonia agrimonoides*, *Fagus sylvatica*, *Ilex aquifolium*, *Ostrya carpinifolia*, *Acer platanoides*, *Galium odoratum*, *Salvia glutinosa*, *Lunaria annua* and *Daphne laureola* indicate pronouncedly humid and relatively cool mesoclimatic conditions (Table IV: 2). Stands recorded at Mt Ossa (E Thessaly), Epirus and Chasia (W Macedonia) with *Selinum silaifolium*, *Clinopodium vulgare*, *Luzula forsteri*, *Campanula spatulata* subsp. *spruneriana*, *Poa trivialis* subsp. *sylvicola*, *Crepis fraasii* and *Silene italica* indicate more thermophytic conditions (Table IV: 3). Considerably less species-rich are formerly coppiced mixed woodlands with *Tilia tomentosa*, *Quercus frainetto*, *Q. petraea* subsp.

medwediewii and *Carpinus orientalis* on remote slopes in the Greek Rodopi Mts (E Macedonia) (Table IV: 1). They differ also in herb layer, revealing a subcontinental touch with *Euphorbia amygdaloides*, *Pulmonaria rubra* and *Campanula persicifolia*.

Genisto carinalis–Quercetum petraeae (Table I, column 4; Table V)

Ecology and forest use: mostly steep to moderately steep slopes, micaschist soils deep, brown, loamy, acidic; 600–1000 m; generally at higher altitude than *Quercus frainetto* forest which may occur in the same areas; previously commonly coppiced but current forest management acts towards transition to forests with single-stemmed trees.

Distribution records (Figure 3): NE Thessaly: Kato Olimbos, Ossa; C Macedonia: Voras, Paiko, Kroussia (Disoro); E Macedonia: Kerdilio, Cholomon, NE Chalkidiki, Rodopi; W Thrace. In NW Greece, *Quercus petraea* subsp. *medwediewii* seems to be less competitive, as no extensive stands dominated by this taxon have been recorded yet.

Diagnostic (bold) and constant species:

Trees and tall shrubs: ***Quercus petraea* subsp. *medwediewii*** (*Q. dalechampii*), *Fagus sylvatica* s.l., ***Carpinus betulus***.

Herbs and small shrubs: ***Campanula persicifolia***, ***Campanula trachelium* subsp. *athoa***, ***Cystopteris fragilis***, ***Dactylis glomerata***, ***Epipactis atrorubens***, ***Euphorbia amygdaloides***, ***Hypericum***

perforatum, ***Poa nemoralis***, ***Potentilla micrantha***, ***Silene atropurpurea***, ***Veronica chamaedrys* s.l.**

Subtypes (Table V: 1 and 2): NE Thessalian stands (Ossa, Kato Olimbos) are recognized by species such as *Campanula spatulata* subsp. *spruneriana*, *Melittis melissophyllum*, *Hieracium bracteolatum*, *Poa trivialis* subsp. *sylvicola*, *Trifolium pignantii*, *Hypericum montbretii*, *Cardamine graeca*, *Rubus hirtus*, *Galium lachnoides*, *Doronicum orientale*, *Geocaryum capillifolium*, and *Festuca drymeja*. *Quercus petraea* woodlands in C and E Macedonia have a distinctly submediterranean-continental species composition (with *Euphorbia amygdaloides*, *Fragaria vesca*, *Festuca valesiaca*, *Campanula persicifolia*, *Silene atropurpurea*).

Querco frainetto–Castanetum sativae (Table I, column 5)

Ecology and forest use: Deep, clayey or loamy, brown micaschist soils, more rarely shallow and calcareous; chiefly in moderately sloped or ridged terrain; (150–)300–800(–1050) m a.s.l.; records include dense coppices as well as spaced groves with old-growth. *Castanea* fruit (sweet chestnut) plantations which are intensely managed differ in species composition depending on age and degree of impact. Old-growth have frequently been, and sometimes still are, roamed by domestic pigs. Many, if not all, woodlands dominated by *Castanea* are likely to originate from plantations or are the result of elimination of other co-occurring tree species.

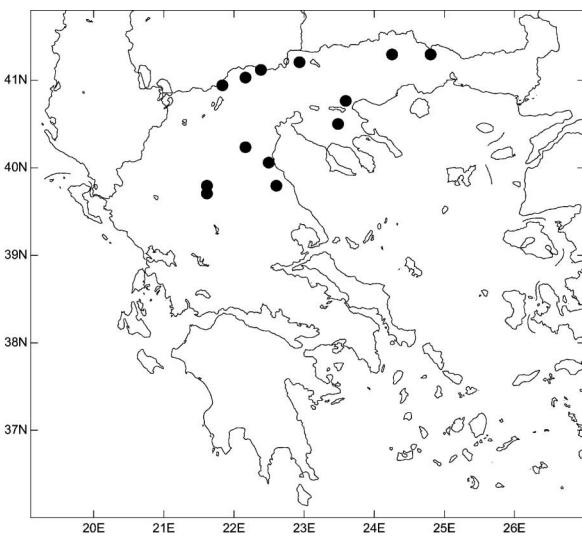

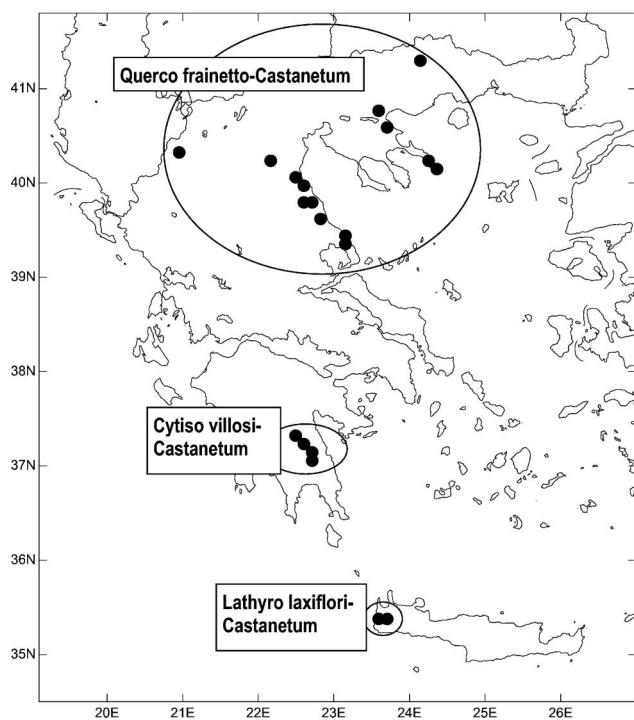

Figure 3. Distribution of the *Castanea* dominated associations (left) and the *Genisto carinalis–Quercetum petraeae* (right). Each dot represents one or more relevés. Only localities with available relevés are plotted.

Table IV. Synoptic table of the subtypes of the association *Tilio tomentosae-Castanetum*: 1, subtype with *Euphorbia amygdaloides*; 2, with *Aremonia agrimonoides*; 3, with *Selinum silaifolium*. Constancy values in percent. Constancy values for species diagnostic for a community type (i.e. occurring with more than double constancy and with >40% in a column) are highlighted. Species with less than 30% constancy in any column are omitted. Strata codes for woody species: t, tree; s, shrub; h, herb layer.

Greek mainland. They occur also on the W Aegean island of Evvia, but no phytosociological records have been published.

Diagnostic (bold) and constant species:

Trees and tall shrubs: ***Castanea sativa***, ***Hedera helix***, ***Teline monspessulana***.

Herbs and small shrubs: ***Brachypodium sylvaticum***, ***Calystegia silvatica***, ***Campanula spatulata* subsp. *spruneriana***, ***Clinopodium vulgare***, ***Crocus veluchensis***, ***Digitalis laevigata***, ***Doronicum orientale***, ***Lathyrus alpestris***, ***Lathyrus laxiflorus***, ***Lithospermum purpurocaeruleum***, ***Luzula forsteri***, ***Primula acaulis***, ***Prunella vulgaris***, ***Pteridium aquilinum***, ***Rubus hirtus***, ***Veronica chamaedrys* s.l.**, ***Viola alba* s.l.**

Subtypes: As knowledge on variation in *Castanea* woodland vegetation in Greece is still rather fragmentary, only one association is distinguished here on the northern mainland. It is distinguished from Peloponnesian *Castanea* stands by mesophilous species such as *Rubus hirtus*, *Primula acaulis*, *Galium laconicum*, *Melittis melissophyllum*, *Hieracium bracteolatum*, *Festuca heterophylla*, *Physospermum cornubiense* and *Helleborus odorus* subsp. *cyclophyllus*.

Cytiso villosae*-*Castanetum sativae (Table I, column 6)

Ecology and forest use: Schistose soils in flysch and micaschist areas, 980–1270 m a.s.l., slopes moderate, often terraced; spacious groves of trees with thick trunks, established for sweet chestnut production, partly abandoned.

Distribution records (Figure 3): Peloponnisos: Parnon.

Diagnostic (bold) and constant species:

Trees and tall shrubs: ***Castanea sativa***, ***Cytisus villosus***.

Herbs and small shrubs: ***Achillea ligustica***, ***Aristolochia elongata***, ***Bromus sterilis***, ***Campanula spatulata*** subsp. ***spruneriana***, ***Campanula stenosiphon***, Clinopodium vulgare, Dactylis glomerata, Doronicum orientale, ***Elymus panormitanus***, ***Epilobium lanceolatum***, ***Euphorbia oblongata***, ***Hypericum vesiculosum***, ***Lathyrus grandiflorus***, Leontodon cichoriaceus, Luzula forsteri, ***Muscari comosum***, ***Orchis mascula***, ***Ornithogalum nutans***, Poa trivialis subsp. ***sylvicola***, Potentilla micrantha, Pteridium aquilinum, ***Ranunculus gracilis***, ***Ranunculus psilostachys***, ***Rumex tuberosus***, ***Saxifraga graeca***, ***Sedum amplexicaule*** subsp. ***tenuifolium***, ***Silene atropurpurea***, Silene viridiflora, Trifolium ochroleucon, Trifolium physodes, Trifolium pignantii, Veronica chamaedrys s.l., ***Vicia lathyroides***, ***Vicia melanops***.

Subtypes: Mesic stands near Kastanitsa are recognized by a larger number of hygrophilous species.

***Lathyrо laxiflori-Castanetum sativae* (Table I, column 7)**

Ecology and forest use: Moderately deep siliceous soils on lower slopes and along streams cut in phyllite-quartzite regions, 350–800 m a.s.l.; the groves consist of old-growth and occur as small patches in suitable locations surrounded by maquis or evergreen wood. They are maintained for sweet chestnut harvesting, or as abandoned pasture woods.

Distribution records (Figure 3): W Crete.

Diagnostic (bold) and constant species:

Trees and tall shrubs: ***Castanea sativa***, ***Platanus orientalis***.

Herbs and small shrubs (selected): ***Aethorhiza bulbosa*** subsp. ***microcephala***, ***Allium subhirsutum***, ***Anthoxanthum odoratum***, ***Arisarum vulgare***, ***Aristolochia sempervirens***, ***Arum creticum***, ***Brachypodium retusum***, ***Charybdis maritima***, ***Crepis fraasii***, ***Cyclamen creticum***, ***Hypericum empetrifolium***, ***Hypericum hircinum*** subsp. ***albimontanum***, ***Lecokia cretica***, ***Luzula forsteri***, ***Oenanthe pimpinelloides***, ***Piptatherum miliaceum***, ***Poa trivialis*** subsp. ***sylvicola***, ***Pteridium aquilinum***, ***Pulicaria odora***, ***Ranunculus paludosus***, ***Ranunculus velutinus***, ***Rubia peregrina***, ***Scaligeria napiformis***, ***Selaginella denticulata***, ***Tamus***

***communis*, *Teucrium massiliense*, *Tolpis virgata*, *Trifolium repens*.**

Subtypes: No attempt was made to distinguish subtypes. The Cretan *Castanea* woodlands are easily distinguished from those of the mainland, as only few plant species of submediterranean distribution extend to Crete.

Table VI. Synoptic table of the subtypes of the association *Sympyton ottomani-Quercetum frainetto*: 1, subtype with *Silene coronaria*; 2, with *Fragaria vesca*, 3, with *Genista carinalis*. Constancy values in percent. Constancy values for species diagnostic for a community type (i.e. occurring with more than double constancy and with >40% in a column) are highlighted. Sympyto ottomani-Quercetum frainetto

(Table I, column 8; Table VI)

Ecology and forest use: Moderate to mostly steep slopes in all expositions with brown siliceous soils over gneiss, micaschist or granitic bedrock, 150–870 m; almost all documented stands show traces of former coppicing; wood pasture is insignificant.

Distribution records (Figure 4): E Macedonia and W Thrace: Rodopi.

Diagnostic (bold) and constant species:

Trees and tall shrubs: *Quercus frainetto*, *Carpinus orientalis*, *Fraxinus ornus*.

Herbs and small shrubs: *Asplenium adiantum-nigrum*, *Brachypodium sylvaticum*, ***Campanula lingu-lata***, ***Carex halleriana***, *Dactylis glomerata* s.l., ***Phleum phleoides***, ***Scabiosa ochroleuca***, ***Securigera varia***, ***Sedum cepaea***, *Veronica chamaedrys* s.l.

Subtypes: The *Sympyto ottomani-Quercetum* is rather poorly defined by differential species. It is distinguished from the other Greek *Quercus frainetto* associations chiefly by the absence of species such as *Lathyrus laxiflorus*, *Galium laconicum*, *Rosa arvensis*, *Doronicum orientale*, *Trifolium ochroleucon*, *Leontodon cichoriaceus*, and *Geocaryum capillifolium*.

Records from NW Xanthi (W Thrace) (Table VI: 1) are distinguished by *Silene coronaria*, *Potentilla*

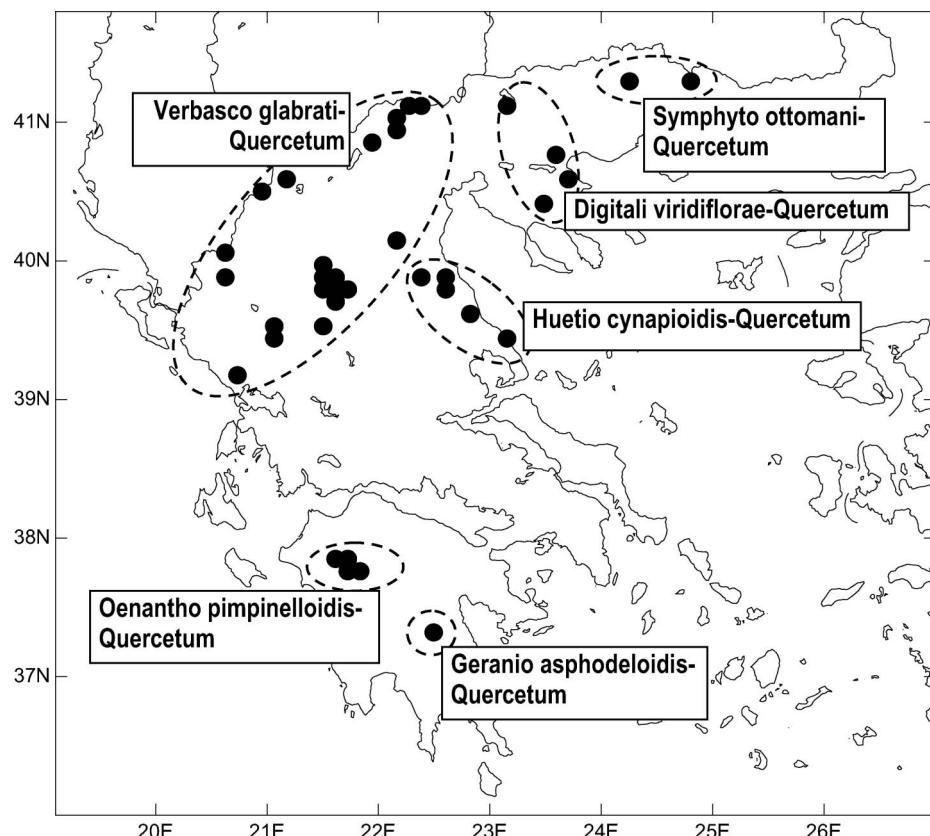

Figure 4. Distribution of the *Quercus frainetto* dominated associations. Each dot represents one or more relevés. Only localities with available relevés are plotted.

micrantha, *Cornus mas*, *Luzula forsteri*, *Campanula lingulata*, the name-giving *Symphytum ottomanum*, and *Silene viridiflora*, suggesting less pronounced subcontinental climatic conditions than in the Nestos area NNE of Drama (E Macedonia). Here, two subtypes exist of which one (Table VI: 2; with *Fragaria vesca*, *Campanula trachelium* and *Primula acaulis*) occurs on soils with better water supply than the other which is differentiated by species such as *Genista carinalis*, *Carex halleriana*, *Thymus sibthorpii*, *Festuca valesiaca* and *Teucrium chamaedrys* which avoid full shade and tolerate drier conditions (Table VI: 3).

Table VII. Synoptic table of the subtypes of the association *Verasco glabratii-Quercetum frainetto*: 1, subtype with *Aira elegantissima*; 2, with *Ruscus aculeatus*; 3, without differential taxa; 4, with *Fraxinus ornus*; 5, subtype with *Galium laconicum*; 6, subtype with *Elymus hispidus*. Constancy values are in percent. Constancy values for species diagnostic for a community type (i.e. occurring with more than double constancy and with >40% in a column) are highlighted. Species with less than 28% constancy in any column are omitted. Strata codes for woody species: t, tree; s, shrub; h, herb layer.

Verbascum glabratum*–*Quercetum frainetto (Table I, column 9; Table VII)

Ecology and forest use: Siliceous, more or less steep brown loamy or sandy-loamy soils on micaschist, flysch, and other schistose non-calcareous bedrock; in slightly to moderately sloped terrain, especially on middle and upper slopes in all expositions, and on ridges, 320–1200 m; both coppices and old-growth pasture woods with single-stemmed trees have been recorded.

Distribution records (Figure 4): Epirus: near Konitsa, Valaoritis, Tsoumerka; W Macedonia: between Kastoria and Florina, Chasia; C and S Macedonia: Paiko, Voras, Pieria.

Diagnostic (bold) and constant species:

Trees and tall shrubs: *Quercus frainetto*, *Cornus mas*, *Cotinus coggygria*, *Juniperus oxycedrus*, *Quercus cerris*.

Herbs and small shrubs: *Agrostis castellana*, *Campanula spatulata* subsp. *spruneri*, *Carex flacca* subsp. *serrulata*, *Crepis fraasii*, *Dactylis glomerata* s.l., *Danthonia alpina*, *Dictamnus albus*, *Echinops ritro*, *Elymus hispidus* subsp. *barbulatus*, *Euphorbia apios*, *Filipendula vulgaris*, *Geocaryum capillifolium*, *Iris sintenisii*, *Lathyrus laxiflorus*, *Luzula forsteri*, *Ptilostemon strictus*, *Rosa gallica*, *Silene viridiflora*, *Stachys scardica*, *Verbascum glabratum*, *Veronica chamaedrys* s.l.

Subtypes: Variation within the *Verbascum glabratum*–*Quercetum frainetto* is complex and due to the plant geographical situation, altitude, soil moisture, and use history. A group of three subtypes with *Rosa gallica*, *Carex flacca*, *Quercus cerris*, *Sorbus domestica* and *Sorbus torminalis* occurs on loamy acidic schistose

soils (Table VII: 4–6). They are widespread throughout the range of the association and are represented by coppices and old-growth pasture woods. Most distinct in species composition are stands from the W Macedonian Chasia mountain range (Table VII: 6; with *Elymus hispidus* subsp. *barbulatus*, *Filipendula vulgaris*, *Stachys scardica*, *Danthonia alpina*). These heliophilous taxa are favoured by regular coppicing and also to a certain degree by wood pasture. *Quercus cerris* and *Q. trojana* are rather frequent in the undergrowth and canopy. Widespread in Macedonia and Epirus are dense coppiced stands on deep soils distinguished from the former by the lack of heliophilous differential species and the occurrence of *Verbascum glabratum*, *Euphorbia amygdaloides*, *Galium laconicum* and *Lathyrus niger* (Table VII: 5). Similar but at lower altitudes and on drier flysch soils in Epirus (near Konitsa) occur mixed *Quercus frainetto*–*Fraxinus ornus* forests with *Ferulago sylvatica* and *Cotinus coggygria* (Table VII: 4). Again distributed from Epirus to W Macedonia, but on lighter, more sandy soils, occurs a variety distinguished by *Ruscus aculeatus*, *Hedera helix* and *Pteridium aquilinum* which is best represented in old-growth woodlands (Table VII: 2–3). The deciduous mistle *Loranthus europaeus* grows typically in such non-coppiced oak trees. At somewhat lower altitudes (400–500 m) species such as *Carex distachya*, *Asplenium onopteris* and *Rosa sempervirens* resemble the field layer of evergreen woodland (Table VII: 2). Irregular coppices which are particularly influenced by wood pasture have been documented from various regions (Chasia, Tsoumerka, Paiko, Voras) and are in fact more common than the available number of relevés suggest (Table VII: 1). They are distinguished by numerous annual species such as *Aira elegantissima*, *Trifolium arvense*, *T. striatum*, *T. tenuifolium*, *Cynosurus echinatus*, *Myosotis arvensis*, and by heliophilous plants of base-impoverished soils such as *Rumex acetosella*.

***Huetio cynapioidis*–*Quercetum frainetto* (Table I, column 10; Table VIII)**

Ecology and forest use: Moderate to steep slopes of all expositions as well as flat and ridged tracts, moderately deep brown sandy-loamy soils in gneiss and micaschist regions, rarely on calcareous sandy soil, 300–1120 m; old-growth pasture woods roamed by domestic pigs and brushwood or stunted forest degraded by irregular cutting and browsing.

Distribution records (Figure 4): E Thessaly and adjacent SE Macedonia: Pilio, Mavrovouni, Kato Olimbos.

Diagnostic (bold) and constant species:

Trees and tall shrubs: *Quercus frainetto*, ***Fagus sylvatica* s.l.**

Constant species: *Anthoxanthum odoratum*, *Campanula spatulata* subsp. *spruneriana*, *Clinopodium*

Table VIII. Synoptic table of the subtypes of the association *Huetio–Quercetum frainetto*: 1, subtype with *Juniperus oxycedrus*; 2, subtype with *Galium laconicum*. Constancy values are in percent. Constancy values for species diagnostic for a community type (i.e. occurring with more than double constancy and with >40% in a column) are highlighted. Species with less than 33% constancy in any column are omitted. Strata codes for woody species: t, tree; s, shrub; h, herb layer.

vulgare, *Cyclamen hederifolium*, *Dactylis glomerata* s.l., *Doronicum orientale*, ***Dorycnium graecum***, *Festuca heterophylla*, ***Galium laconicum***, *Hieracium bracteolatum*, *Lathyrus laxiflorus*, *Luzula forsteri*, *Melittis melissophyllum* subsp. *albida*, *Poa trivialis* subsp. *sylvicola*, *Potentilla micrantha*, *Pteridium aquilinum*, *Selinum silaifolium*, *Silene italica* s.str., *Trifolium ochroleucon*, *Trifolium pignantii*, ***Verbascum aphentulum***, *Veronica chamaedrys* s.l., *Vicia tenuifolia*.

Subtypes: Typically, the *Huetio cynapioidis*–*Quercetum frainetto* is represented in E Thessaly by mesic pasture woods with single-stemmed old-growth, characterized by species such as *Galium laconicum*, *Melittis melissophyllum*, *Hieracium bracteolatum* and *Verbascum aphentulum* (Table VIII: 2). Brushwood with stunted trees has been documented from Mavrovouni and Kato Olimbos and is distinguished by undergrowth of *Juniperus oxycedrus*, *Quercus coccifera*, *Q. pubescens* and other woody species that tolerate browsing (Table VIII: 1).

Digitali viridiflorae*–*Quercetum frainetto (Table I, column 11; Table IX)

Ecology and forest use: Slightly sloped to very steep terrain in quartzitic and micaschist areas; schistose soils are moderately acidic, loamy to sandy-loamy; 350–1040 m; locally prevalent are coppices with or without wood pasture.

Distribution records (Figure 4): E Macedonia: Cholomon (Chalkidiki), Kerdilio, Kilkis.

Diagnostic (bold) and constant species:

Trees and tall shrubs: *Quercus frainetto*, *Crataegus monogyna* s.l., ***Fagus sylvatica*** s.l.

Herbs and small shrubs: ***Aristolochia pallida***, ***Asperula purpurea*** subsp. *apiculata*, ***Cephaelanthera longifolia***, ***Cruciata laevipes***, *Dactylis glomerata* s.l., ***Digitalis viridiflora***, ***Fragaria vesca***, ***Helleborus odorus*** subsp. *cyclophyllus*, ***Hieracium bracteolatum***, *Luzula forsteri*, ***Muscari neglectum***, ***Platanthera chlorantha***, ***Primula veris*** subsp. *columnae*, ***Ranunculus rumelicus***, *Rubus canescens*, ***Sedum hispanicum***, *Symphytum*

Table IX. Synoptic table of the subtypes of the association *Digitali viridiflorae*–*Quercetum frainetto*: 1, subtype with *Anthemis tinctoria*; 2, with *Helleborus odorus* subsp. *cyclophyllus*. Constancy values are in percent. Constancy values for species diagnostic for a community type (i.e. occurring with more than double constancy and with $> 40\%$ in a column) are highlighted. Species with less than 30% constancy in any column are omitted. Strata codes for woody species: t, tree; s, shrub; h, herb layer.

Ecology and forest use: Loamy, base-poor micaschist soils, rarely calcareous, in slightly to moderately sloped terrain, preferably on lower slopes, 960–1300 m; previously coppiced stands, now commonly developed to single-stemmed trees with thin trunks and coppice-stools.

Distribution records (Figure 4): SE Peloponnisos: N Parnon.

Diagnostic (bold) and constant species:

Trees and tall shrubs: *Quercus frainetto*, *Castanea sativa*, *Erica arborea*, *Juniperus oxycedrus*, ***Pinus nigra***.

Herbs and small shrubs: *Arenaria agrimonoides*, ***Arrhenatherum elatius***, *Brachypodium sylvaticum*, *Campanula spatulata* subsp. *spruneriana*, ***Chamaespartium sagittale***, *Clinopodium vulgare*, *Cyclamen peloponnesiacum*, *Dactylis glomerata* s.l., *Doronicum orientale*, ***Euphorbia rigida***, *Festuca circummediterranea*, ***Genista acanthoclada***, ***Geranium asphodeloides***, *Luzula forsteri*, ***Orchis mascula***, *Platanthera chlorantha*, *Potentilla micrantha*, *Pteridium*

aquilinum, ***Rubia tenuifolia***, *Trifolium pignantii*, *Veronica chamaedrys* s.l.

Subtypes: Further subdivision of the scarce and geographically restricted data does not seem reasonable.

Oenanthe pimpinelloides*–*Quercetum frainetto

(Table I, column 13; Table X)

Ecology and forest use: Moderately deep to deep brown soils and ranker, loamy–sandy, derived from conglomerate, moderately sloped or flat tracts and dry ravines and streambeds; 320–870 m; more or less spacious pasture wood with old-growth trees.

Distribution records (Figure 4): W Peloponnisos: Foloi (Ilía).

Diagnostic (bold) and constant species:

Trees and tall shrubs: *Quercus frainetto*, ***Erica arborea***, ***Arbutus unedo***.

Herbs and small shrubs: ***Anemone blanda***, ***Asphodelus ramosus***, *Brachypodium sylvaticum*, ***Carex distachya***, *Dactylis glomerata* s.l., ***Digitalis ferruginea***, ***Elymus panormitanus***, *Lathyrus laxiflorus*, *Leontodon cichoriaceus*, ***Loranthus europaeus***, *Luzula forsteri*, ***Oenanthe pimpinelloides***, ***Phlomis samia***, *Poa trivialis* subsp. *sylvicola*, *Potentilla micrantha*, *Pteridium aquilinum*, *Silene italica* subsp. *peloponnesiaca*, ***Achnatherum bromoides***, ***Trifolium physodes***, *Veronica chamaedrys* s.l.

Subtypes: Mesic woods in depressions and on northern slopes of ravines, often with thick leaf litter layer, without much grazing impact, are distinguished by *Arbutus unedo*, *Melittis melissophyllum*, *Asplenium onopteris*, *Brachypodium rupestre* and *Sorbus torminalis* (Table X: 2). Stands in flat or slightly inclined terrain are similar but the mentioned species are missing (Table X: 3). More open stands along forest tracks or with severe grazing impact have impoverished soils with patchy leaf litter layer. They are distinguished by numerous annuals such as *Cerastium brachypetalum*, *Aira elegantissima*, *Galium divaricatum*, *Trifolium campestre*, *Psilurus incurvus*, *Veronica arvensis*, *Sherardia arvensis*, and others (Table X: 4). Somewhat similar (with *Oenanthe pimpinelloides*) is the *Geranio peloponnesiaci*–*Quercetum frainetto* described by Barbero and Quézel (1976) which occurs on flysch and schist in N Peloponnisos (Achaia, SE Korinthos). Our association from Ilía differs in the absence of undergrowth species such as *Carpinus orientalis*, *Fraxinus ornus*, *Ostrya carpinifolia*, and *Hippocratea emerus*. As no recent data from N Peloponnisos are available and due to obvious taxonomic errors in the original table, we prefer to exclude the *Geranio peloponnesiaci*–*Quercetum* from the present account. However, this association may well be the third *Quercus frainetto* community in S Greece.

Discussion

Differentiation of the Quercion frainetto associations

The six vicarious associations of *Quercus frainetto* forests in Greece occur almost exclusively on siliceous soils on flysch, gneiss, micaschist, conglomerate or granite. The range of elevation is between 150 and 1300 m, with the lowest sites in the north-east (*Sympyto ottomani*-*Quercetum*) and the highest in the south (*Geranio asphodeloidis*-*Quercetum*), corresponding to the north-south temperature gradient. Konstantinidis et al. (2002) found a range of precipitation between 615 and 1200 mm and sub-humid overall bioclimatic conditions in *Quercion frainetto* locations throughout mainland Greece. The principal differences in species composition among the six associations correspond to a regional pattern (Figure 4). Other floristic gradients observed are related to local topography, elevation, soil moisture, human impact and use history. Such variation is recognized here on subtype level. Konstantinidis et al. (2002) ignored the samples of *Quercus frainetto* forests published in previous studies and distinguished only two vicarious associations in Greece, based on merely 39 relevés, from 7 sites, plus 5 relevés of a *Quercus petraea* subsp. *medwediewii* (*Q. dalechampii*) community. Our analysis of *Quercus frainetto* forest vegetation is based on 406 relevés from numerous sites. Although we consider the present classification on a national scale a substantial progress compared to previous attempts (Dafis 1973; Horvat et al. 1974; Konstantinidis et al. 2002), the known variation is still fragmentary. No samples are available for extensive regions, and the assumed transient areas between associations are tentative. The geographical gaps are recommended for further study.

The principal variation in species composition of *Castanea sativa* forests in Greece suggests a geographical differentiation reflecting climatic gradients and, perhaps, isolation effects, rather than differences in local abiotic factors. The soils are more or less acidic and indiscriminately developed from siliceous bedrock. The water supply is generally better than in *Quercus frainetto* forests. Our classification in two associations on the Greek mainland is certainly provisional as not all core areas of *Castanea* distribution that should be considered are represented. There is a lack of thoroughly investigated local studies. *Castanea* forests in Greece were recently studied by Konstantinidis et al. (2008). According to these authors, local silvicultural effects are said to be most important in explaining the floristic composition. Somewhat self-contradictory, they distinguish three vicarious communities or community groups in northern, central and southern mainland Greece, respectively. The association names put forward by Konstantinidis et al. (2008)

are invalid for nomenclatural reasons (Weber et al. 2000).

Circumscription of the alliances in Greece

The alliances *Fraxino orni*-*Ostryion* (in the geobotanical literature of the Balkans commonly referred to as *Ostryo-Carpinion orientalis* or *Carpinion orientalis* but see annotation 1 below) and *Quercion frainetto* have often been interpreted as representative for “submediterranean” and “continental” bioclimatic conditions, respectively (Oberdorfer 1948; Horvat et al. 1974). However, the present analysis confirms that the two alliances have many species in common and co-occur in most of the submediterranean domain in mainland Greece. Zoller et al. (1977) and Bergmeier (1990) noticed that soil and topography, hence bedrock and local climate, are crucial factors determining local variation in thermophilous deciduous forest vegetation. Our study demonstrates (Figure 1) that soil and topographic conditions are indeed more important than a macro-climatic gradient for explaining the variation in the data set. Plant communities of the *Fraxino orni*-*Ostryion* occur chiefly on calcareous stony soils, whilst *Quercion frainetto* woods grow almost invariably on siliceous soils. Degraded stunted woods of the latter may be rich in *Carpinus orientalis* and resemble *Fraxino orni*-*Ostryion* woodlands. As *Fraxino orni*-*Ostryion* and *Quercion frainetto* differ chiefly in habitat ecology (soil, local climate) they are not suitable to define plant geographical zones in the southern Balkans.

Differential species of the *Fraxino orni*-*Ostryion* in Greece are *Quercus pubescens*, *Acer monspessulanum*, *Ostrya carpinifolia*, *Lithospermum purpurocaeruleum*, *Hippocratea emerus* subsp. *emeroides*, *Arabis turrita*, *Euonymus verrucosus*, *Daphne laureola* and *Lathyrus venetus*, and also, to a limited extent, *Carpinus orientalis* and *Fraxinus ornus*. The *Quercion frainetto* is recognized by *Quercus frainetto*, *Q. petraea* subsp. *medwediewii*, *Geocaryum capillifolium*, *Sympyrum bulbosum*, *Trifolium pignantii*, *Doronicum orientale*, *Phlomis samia*, as well as many species restricted to one or few communities such as *Helleborus odorus* subsp. *cyclophyllus*, *Elymus panormitanus*, *Rosa gallica*, *Verbascum glabratum*, and *Ptilostemon strictus*.

Greek thermophilous deciduous forest from a broader perspective

Many widespread species of the southern European submediterranean zone (and supra-Mediterranean belt) underpin the close geographical relation of the Greek thermophilous deciduous forests with their counterparts from Spain to Italy. Among those species are common, e.g. *Luzula forsteri*, *Potentilla micrantha*, *Rubus canescens*, *Viola alba*, *Silene italica*,

Rosa arvensis, *Festuca heterophylla*, *Trifolium ochroleucum*, *Juniperus oxycedrus*, *Sorbus torminalis*, and *Primula acaulis*. Therefore, in the phytosociological analysis, most thermophilous deciduous forests of the southern Balkans belong to the order *Quercetalia pubescens* (except for the Cretan stands which are devoid of most submediterranean and Balkanic species).

The *Quercion frainetto* is the most common and widespread alliance of the *Quercetalia pubescens* in Greece. In total, it extends from the central and southern Balkans to western Anatolia. In Italy, its counterpart is the *Teucrio siculi–Quercion cerridis* Ubaldi 1988 which, like the *Quercion frainetto* associations, occurs chiefly on non-calcareous soils (Biondi et al. 2001; Blasi et al. 2002, 2004). The *Teucrio siculi–Quercion*, however, comprises mainly *Quercus cerris* woodlands, while *Q. frainetto* is rarely the dominant tree. In the *Quercion frainetto*, it is vice versa.

In contrast to the northern Balkans, the northern Mediterranean and northern Anatolia, *Castanea* forests of the Greek mainland are commonly included in the *Quercion frainetto*. *Castanea* and *Quercus frainetto* forests share species such as *Doronicum orientale*, *Trifolium pignantii*, *Sympyrum bulbosum* and *Campanula spatulata* subsp. *spruneriana* which are infrequent or absent from most *Castanea* forests further north. As elsewhere, the distribution of *Castanea sativa* was much extended by early plantations and subsequent naturalization. The Cretan occurrences in the *Lathyro laxiflorae–Castanetum*, for instance, are almost certainly not native.

The alliance *Fraxino orni–Ostryion* is widespread from peninsular Italy and Sicily through the Balkans, reaching northward Austria and the southern Alps (Poldini 1988; Blasi et al. 2001, 2004; Willner & Gralbher 2007). In Italy, it is represented by four suballiances (Blasi et al. 2004), of which two show striking coenological and floristic similarities with the two associations distinguished in Greece. The more thermophilous and xerophytic *Phillyreо latifoliae–Carpinetum orientalis* corresponds to the *Lauro–Quercenion pubescens* Ubaldi 1995 of southern and central Italy. The more mesophytic *Dryopterido pallidae–Ostryetum carpinifoliae* is related to the *Laburno anagyroidis–Ostryenion carpinifoliae* occurring along the Apennine chain. In the Map of the Natural Vegetation of Europe (Bohn et al. 2000/2003) the Balkanic and Apennine *Ostrya*-rich forest units form a subgroup of the submediterranean and supra-Mediterranean thermophilous mixed forests (Domić et al. 2003). Clearly, the ecological similarities on both sides of the Adriatic Sea are accompanied by dissimilarities due to distribution preferences of “Balkanic” and “Italic” species, respectively. In his survey of the *Fraxino orni–Ostryion* (“*Ostryo–Carpinon*”) in south-east Europe and the Apennine

peninsula, Poldini (1988) distinguished three vicarious suballiances, with the *Syringo–Carpinenion* Jakucs 1959 in the east Balkanic–Aegean sector. However, almost all relevés available to him at that time represent secondary deciduous and semi-evergreen scrub, so-called *šiblyak* and *pseudomaquis*. Such data were of little value to define the west–east floristic gradient within the *Fraxino orni–Ostryion* (Bergmeier 1990). Nevertheless, the concept of three vicarious suballiances may be maintained, with many chiefly Balkanic taxa such as *Lathyrus laxiflorus*, *Leontodon cichoriaceus*, *Campanula spatulata* subsp. *spruneriana*, *Cardamine graeca* differentiating the eastern unit, *Syringo–Carpinenion*. Within this, however, and in parallel with the Italian concept (Blasi et al. 2004), the ecological gradient of water supply deserves more attention in future studies.

Nomenclatural annotations

Annotation 1:

The name *Fraxino orni–Ostryion* Tomažić 1940 antedates the hitherto commonly used names *Carpinion orientalis* Horvat 1958 and *Ostryo–Carpinion orientalis* Ht. ex Horvat 1959. The latter two fall into synonymy after the lectotypification of Tomažić’ name by Willner et al. (2005) (see also Willner & Grabherr 2007).

Annotation 2:

Typus relevé (holotype) of the *Phillyreо latifoliae–Carpinetum orientalis* Bergmeier ass. nov.

Relevé code: Bergmeier 2001–154 (10889); 21 June 2001; N Greece, Paiko, above (= NE) Konstantia (E Aridea); lat-long co-ordinates 41°00'32"N 22°11'17"E, 430 m asl, exposition NW, slope 15°, dense coppiced forest, oak trunks 18 cm diameter, *F. ormus/Carpinus orientalis* 10 cm diam., multi-stemmed, not grazed; cover tree layer 90%, shrub layer 30%, herb layer 10%, no bryophyte layer, height trees 6–10 m, height shrubs 2.5 m; plot size 100 m².

Carpinus orientalis t2 4, *Carpinus orientalis* s1 2a, *Carpinus orientalis* h +, *Fraxinus ormus* t2 3, *Fraxinus ormus* s1 1, *Fraxinus ormus* h +, *Juniperus oxycedrus* s1 +, *Juniperus oxycedrus* h 2m, *Phillyrea latifolia* s1 1, *Phillyrea latifolia* s2 1, *Phillyrea latifolia* h 2m, *Quercus frainetto* t1 2a, *Quercus frainetto* h +, *Quercus coccifera* t3 +, *Quercus coccifera* s1 1, *Quercus coccifera* h 1, *Quercus pubescens* h +, *Asplenium onopteris* 1, *Cardamine graeca* 1, *Carex distachya* 1, *Ligustrum vulgare* 1, *Luzula forsteri* 1, *Melica uniflora* 1, *Viola alba* 1, *Aremonia agrimonoides* +, *Asplenium ceterach* +, *Brachypodium rupestre* +, *Brachypodium sylvaticum* +, *Clematis flammula* +, *Cornus mas* +, *Hippocratea emerus* subsp.

emeroides +, *Lathyrus laxiflorus* +, *Limodorum abortivum* +, *Lithospermum purpurocaeruleum* +, *Poa nemoralis* +, *Potentilla micrantha* +, *Rosa arvensis* +, *Ruscus aculeatus* +, *Sorbus torminalis* h +, *Trifolium medium* +, *Veronica chamaedrys* +, *Tanacetum corymbosum* r.

Annotation 3:

The name *Quercus conferta* Kit. is used in the taxonomic literature of the last decades only as synonym of *Quercus frainetto* Ten. The name of the alliance *Quercion confertae* which was validated by Horvat (1958) is updated here to *Quercion frainetto* (following art. 45 ICPN, nomen mutatum propositum), a name which has much been in use in geobotanical literature since Horvat et al. (1974: 235).

Annotation 4:

The alliance *Melitto-Quercion* was suggested by Barbero and Quézel (1976) and Bonin and Gaminsans (1976) to comprise the southernmost *Quercus frainetto* forests of southern Greece (Peloponnisos) and southern Italy. The difference in species composition with “mediterranean” species in the *Melitto-Quercion* and “continental-balkanic” species in the *Quercion frainetto* was stressed. However, floristic differences between *Melitto-Quercion* and *Quercion frainetto* are hardly more pronounced than between associations in each alliance. In fact, the two syntaxa are clear biogeographical vicariants, and the former may be maintained as suballiance within a widely circumscribed *Quercion frainetto*.

Annotation 5:

The *Cytiso villosi-Castanetum* as circumscribed by Barbero and Quézel (1976, table 9, rels 1–16) includes relevés of woodlands dominated by *Castanea sativa*, *Quercus frainetto*, or *Ostrya carpinifolia*. The association is emended here to be restricted to *Castanea* groves of southern mainland Greece with Peloponnisos.

Annotation 6:

The name of the *Huetio-Quercetum frainetto* was coined by Raus (1977) as nomen nudum (art. 2 ICPN, Weber et al. 2000) and published in Raus (1980) together with a relevé table but without indication of a nomenclatural type (articles 3o and 5 ICPN). The name is validated by Thomas Raus with the missing element (holotype) selected and published here (see synopsis).

Annotation 7:

Typus relevé (holotype) of the *Geranio asphodeloidis-Quercetum frainetto* Bergmeier ass. nov.

Relevé code Bergmeier 1996–170 (25323); 21 May 1996; Greece, Peloponnese, Mt. Parnon, Aj. Petros in the direction of Kariés, S of the road;

lat-long co-ord. 37°18'45"N 22°31'51"E; 1200 m asl, aspect W, slope 25°, schist; old oak coppice with a few single-stemmed oaks; cover tree layer 55%, shrub layer 5%, herb layer 15%, no bryophyte layer, height highest trees 14 m, highest shrubs 2 m; plot size 250 m².

Quercus frainetto t 4, *Quercus frainetto* s +, *Pteridium aquilinum* 2a, *Luzula forsteri* 2a, *Geranium asphodeloides* 1, *Galium violaceum* 1, *Erica arborea* s 1, *Dorycnium herbaceum* 1, *Doronicum orientale* 1, *Dactylis glomerata* subsp. *hispanica* 1, *Cyclamen peloponnesiacum* 1, *Brachypodium sylvaticum* 1, *Veronica chamaedrys* subsp. *chamaedryoides* 1, *Potentilla micrantha* 1, *Lathyrus laxiflorus* +, *Lathyrus digitatus* +, *Festuca jeanpertii* +, *Cruciata laevipes* +, *Clinopodium vulgare* +, *Chamaespartium sagittale* +, *Chamaecytisus hirsutus* +, *Arenaria agrimonoides* +, *Trifolium pignantii* +, *Trifolium alpestre* +, *Silene italica* subsp. *peloponnesiaca* +, *Sanguisorba minor* +, *Rubus canescens* +, *Poa nemoralis* +, *Orchis mascula* +, *Juniperus oxycedrus* s r, *Dactylorhiza romana* r, *Carex distachya* r, *Trifolium ochroleucon* r, *Platanthera chlorantha* r, *Pinus nigra* t r.

Annotation 8:

Typus relevé (holotype) of the *Oenanthe pimpinelloides-Quercetum frainetto* Bergmeier & Dimopoulos ass. nov.

Relevé code: Bergmeier & Dimopoulos 1998–141; Greece, Peloponnisos, Province Ilía, Forest of Foloi, S of Koumanis, lat-long co-ordinates 37°46'06"N 21°45'19"E; 10 June 1998; 720 m a.s.l., aspect W, slope 5°; old-growth oak forest, cover tree layer 75%, shrub layer 10%, herb layer 50%, mosses around trunk bases, almost closed leaf litter layer, height trees to 22 m, shrubs to 3 m; plot size 400 m².

Quercus frainetto t 4, *Quercus frainetto* s 2a, *Quercus frainetto* h 2b, *Pteridium aquilinum* 3, *Anemone blanda* 1, *Arenaria agrimonoides* 1, *Asphodelus ramosus* 1, *Brachypodium sylvaticum* 1, *Dactylis glomerata* 1, *Elymus panormitanus* 1, *Loranthus europaeus* 1, *Phlomis samia* 1, *Poa trivialis* subsp. *sylvicola* 1, *Carex distachya* +, *Cyclamen hederifolium* +, *Cynosurus echinatus* +, *Lathyrus laxiflorus* +, *Leontodon cichoriaceus* +, *Melittis melissophyllum* subsp. *albida* +, *Oenanthe pimpinelloides* +, *Poa bulbosa* +, *Potentilla micrantha* +, *Rubus canescens* +, *Symphytum bulbosum* +, *Trifolium campestre* +, *Trifolium ochroleucon* +, *Trifolium physodes* +, *Veronica chamaedrys* +, *Limodorum abortivum* r, *Silene italica* subsp. *peloponnesiaca* r.

Annotation 9:

The *Tilio-Castanetum* has been assigned to the alliance *Quercion frainetto* by Dafis (1973) and Petermann (1999), and to the *Tilio-Acerion* Klika 1955 by Bergmeier (1990). In view of the full floristic range, as far as currently known this association shows similarities with *Fraxino orni-Ostryion*,

Quercion frainetto, and *Tilio-Acerion*. We are aware that mesic mixed forests with *Tilia* in Greece show more affinities to *Quercetalia pubescens* than to *Fagetalia*. Pending a survey of such forests of the southern Balkans, we prefer to stress the specific floristic status of the *Tilio-Castanetum* in keeping it separate from the *Fraxino ornii-Ostryion* as well as from the *Quercion frainetto*, whilst we refrain, for the time being, from formally describing a third alliance before knowing its full coenological range.

Annotation 10:

The name *Lathyrus stenolobi-Castanetum sativae* coined by Brullo et al. (2004: 404) for Cretan *Castanea* groves is based on a table published by Barbero and Quézel (1980) under the name *Oenanthe pimpinelloides-Quercetum brachyphyllae castanetosum sativae*. The latter name was invalidly published as no nomenclatural type was designated. *Lathyrus stenolobus* is present in the original table although it is a southern Anatolian taxon which does not occur in Crete. It is not quite clear which taxon had been mistaken as *L. stenolobus*. The only other *Lathyrus* species which occurs, though rarely, in Cretan *Castanea* groves (and is even exclusive to this kind of forest in Crete) is *L. laxiflorus*, a taxon which is morphologically entirely different. The wetland endemic *Lathyrus neurolobus* that bears a somewhat similar name occurs at springs which are sometimes associated with *Castanea* groves but is not a constituent of the forest vegetation (Bergmeier & Abrahamczyk 2007). As no younger valid name is available, the name *Lathyrus stenolobi-Castanetum sativae* is corrected here to *Lathyrus laxiflori-Castanetum sativae*, following ICPN article 43.

Conservation issues

Thermophilous deciduous oak and mixed oak woodlands are represented in 54 out of 359 Greek Natura 2000 sites (Bergmeier et al. 2004; Petermann 2005). A total of about 80,000 ha is situated in the Natura 2000 network, but in the process of designation little attention has been paid to thermophilous deciduous woodland, which is present in only five sites with proportions exceeding 25% of the surface area. The Annex of the Habitats Directive lists only three types of thermophilous deciduous forest to which Greek stands belong: 9250, *Quercus trojana* woodlands; 9260, *Castanea sativa* woods; 9280, *Quercus frainetto* woods. Other types have been neglected during the compilation process.

Forestry is generally not restricted in Greek Natura 2000 sites although forestry and conservation aims may not be congruent. Principal conservation efforts should focus on old-growth non-coppiced woodland with thick single-stemmed trees. Such

stands have been recorded in Ilia (Dimopoulos & Bergmeier 2004), southern Pindos (Valaoritis, Tsoumerka), W Macedonia (Chasia), E Thessaly, and E Macedonia (Athos peninsula), and they represent the associations *Oenanthe pimpinelloides-Quercetum frainetto*, *Verbasco glabratii-Quercetum frainetto*, *Huetio cynapioides-Quercetum frainetto*, *Querco frainetto-Castanetum*, *Tilio tomentosae-Castanetum* and *Dryopterido pallidae-Ostryetum*. We are not aware of old-growth stands of any of the other associations. Effective conservation management should pay special attention to a balanced grazing regime in order to allow rejuvenation.

Acknowledgements

Sincere thanks are given to Thomas Raus, Giannis Tsiripidis, Jörg Petermann and two anonymous reviewers who read, and commented on, an earlier version of the manuscript.
